

Telegram QA Bot User Guide

Bot URL: @QA_TOTO_bot

Reviewer user login code: qa-user-2026

This bot is a ChatOps interface for the Digitain AI QA Agent. It lets a reviewer run the same Excel-driven QA automation from Telegram, watch status, and receive HTML/JSON reports after the run.

Safety Rule

Telegram-triggered runs are always dry-run safe. The bot does not expose real-money deposit, withdrawal, or final bet-submit actions. This matters because TotoGaming.ro is a regulated real-money gambling platform.

How To Join As A Reviewer

Step	Action	Expected result
1	Open Telegram and search for @QA_TOTO_bot.	The bot chat opens.
2	Send /start.	If not authorized yet, the bot shows access guidance and your Telegram numeric ID.
3	Send /login qa-user-2026.	You are added as a regular user, up to the configured two-user limit.
4	Send /menu.	The main menu opens with Run Tests, Reports, Status and Help.

Recommended Review Flow

Command	Purpose	Why use it
/whoami	Shows your Telegram ID and role.	Confirms access is configured correctly.
/run_id simple-1	Runs one fast invalid-login test.	Best first smoke check.
/status	Shows the active job and latest output.	Useful during longer browser runs.
/reports	Sends the latest HTML and JSON reports.	Lets the reviewer inspect evidence.
/run_simple	Runs the simple test suite.	Good demo of safe production checks and blocked-precondition reasoning.
/run_complex	Runs the complex suite.	Good demo of sportsbook, casino, provider, and staging-boundary logic.

Button Hierarchy

Menu area	What it contains
Run Tests	Run All, Run Simple, Run Complex, By Category, Specific ID.
Reports	Latest report and report list.
Status	Current job status plus recent CLI output.
Help	Command reference and safety note.

Business Value

The bot makes the QA system usable by non-developers while preserving governance. A QA lead can trigger a suite from Telegram, receive the report, and see which cases passed, which are blocked, and exactly what staging data is needed for full completion. That is the difference between a script and an operational QA tool.

Note: the shared reviewer code is a regular user code, not an admin code. It can be rotated after evaluation.
